

# The role of organizational learning and innovative organizational culture for ambidextrous innovation

Mohammad Khalid AlSaied and Abdullah Abdulaziz Alkhoraif

## Abstract:

**Purpose:** In the era of hyper-competitiveness, firms, especially project-based management structures, have to focus on ideas for both new and existing sets of products and services, i.e., ambidextrous innovation. The ambidextrous innovation can be helpful, but achieving such a level is a problem to be solved. The present research is aimed at yielding ambidextrous innovation by utilizing innovative culture and knowledge that has been gained from learning.

**Research Methodology:** The present research collected data from Saudi Arabian public-sector firms. The data collected is analyzed using the Partial Least Squares Structural Equation Modelling (PLS-SEM).

**Findings:** The findings of the study suggest that a range of factors can be operationalized in project-based firms to establish organizational learning and innovation culture. These factors include agile-based project management, leveraging existing innovative capabilities and growth mindset in case of innovative organizational culture and additional factors of agile-based knowledge management along with others in case of organizational learning. The PLS-SEM further concluded that both organizational learning and innovative organizational culture, in turn, help project-based Saudi Arabian public-sector firms to develop their ambidextrous innovation capability.

**Keywords:** Ambidextrous innovation, Organizational learning, Organizational innovative, Agile, Knowledge Management, Project Management, Growth mindset.

## 1. Introduction:

The ambidextrous innovation has attracted a lot of interest from the scholarly and managerial community over a period of time (Grover et al., 2007). Ambidextrous innovation can be defined as an innovation that balances the innovating of new products and services (Grover et al., 2007), referred to as explorative innovation and develops and improving the existing product and services to meet existing needs, referred to as exploitative innovation (Martini et al., 2003). The recent literature suggests that ambidextrous innovation has helped organizations, especially project

1  
2  
3 teams, gain a competitive advantage by using available in-house and out-house knowledge,  
4 competencies, and insights (Xie et al., 2020). So, it enables the project team to keep up with the  
5 fast-paced market trends and continuously provide value to their consumers by launching products  
6 and services demanded by consumers (Lee et al., 2023). Although ambidextrous innovation offers  
7 a wide range of advantages to organizations and project teams, as concluded by recent systematic  
8 review studies conducted by Chakma et al. (2021), it still remains a problem for firms to achieve  
9 the level of ambidexterity in the innovation sphere. Researchers from theoretical aspects, such as  
10 (Simsek, 2009; Werder & Heckmann, 2019), have been conceptualizing various antecedents that  
11 can help the organization to develop the dynamic capability of ambidextrous innovation. But, such  
12 theoretical conceptualization would need empirical support from the project level to make a solid  
13 contribution to the current literature on ambidextrous innovation. It is worth mentioning that  
14 various empirical studies, such as (Lee et al., 2023), have added critical insight into the current  
15 literature.

16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26 In recent years, scholars have been focusing on the construct of organizational culture (Ouchi &  
27 Wilkins, 1985) and learning (Levitt & March, 1988). The culture would be defined as the set of  
28 shared rules, norms, values, and behavioral patterns (Ouchi & Wilkins, 1985), while learning  
29 would be better defined as “development of insights, knowledge and associations between past  
30 actions, the effectiveness of those actions, and future actions” (Fiol & Lyles, 1985, p. 811). A  
31 culture that is rooted in innovation can be a determining factor for a project team's success (Joseph  
32 & Kibera, 2019). The literature suggests that innovative culture can also enhance ambidextrous  
33 innovation through the instrument of empowerment and collaboration, which can push teams to  
34 try and experiment with new ideas for products and services (Ju et al., 2020). Learning is quite a  
35 consistent phenomenon within the project with ambidextrous innovation as both attempts to  
36 employ the knowledge available inside and outside organizations for their relative purposes (Guo  
37 et al., 2020). Thus, organizational learning and innovation culture can help the organization  
38 achieve its ambidextrous innovation ambitions. However, despite the importance, complimentary  
39 role, and logical consistency of both culture and learning of organization with ambidextrous  
40 innovation, empirical evidence, especially at the project team level, is negligible in the present  
41 literature.

60

1  
2  
3 To make the current discussion more impactful from an empirical perspective, we have to dive  
4 deep into the literature and attempt to understand the possible set of dimensions that can impact  
5 ambidextrous. One of the key elements that have really attracted scholars' attention is the agility  
6 of the project team (Lill & Wald, 2021). The literature suggests that agility can make teams both  
7 innovative and help them acquire and use knowledge for product innovation and improvement (Ju  
8 et al., 2020). Secondly, knowledge management is also cast as an important driver in learning and  
9 making an organization's culture innovative through acquiring and utilizing experience and  
10 information (Azeem et al., 2021). Thirdly, the dynamic, innovative capability is a natural driver of  
11 innovative organizational culture (Iranmanesh et al., 2021) and learning (Bell & Figueiredo, 2012).  
12 Finally, the present research has focused on the novel construct of the growth mindset, which is  
13 belief that individual's varying natural capabilities can be improved through learning, experiences,  
14 and experiments (Yeager & Dweck, 2020). The presence of a growth mindset would always  
15 expedite the process of both learning (Hanson et al., 2016) and innovation in the organization  
16 (Canning et al., 2016). Thus, the purpose of the present research study is to examine ambidextrous  
17 innovation (Xie et al., 2020). Present research theorizes that organizational learning and innovative  
18 culture can play an important role in achieving ambidexterity. The learning is important as  
19 ambidexterity would require a high level of knowledge of the product, services, and process to  
20 reconfigure (Joseph & Kibera, 2019). Further, an innovative organizational culture that values new  
21 ideas and experiments can complement learning within the organization. Although such  
22 theorization is widely prevalent in the literature, it would need empirical support in context of  
23 project organization. Thus, the purpose of the present research is to collect empirical evidence and  
24 assess the effect of factors organizational learning and innovative organizational on project  
25 organizations' quest for ambidexterity. The rest of the paper follows the research purpose, literature  
26 review, research method, data analysis, discussion, and conclusion.

## 2. Literature review

### 2.1. Agile project management:

46  
47  
48 Agile project management can be defined as tools and techniques in which a project is efficiently  
49 managed in situations of both complexity and uncertainty (Dybå et al., 2014). In general, "agile  
50 project management is characterized by short cycles of iterative and incremental delivery of  
51 product features and continuous integration of code changes" (Dybå et al., 2014, p.280). Agile  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 project management encompasses an important element of up-front planning in which important  
4 and essential decisions are being undertaken during the implementation phase of the project itself  
5 (Dybå et al., 2014). Agile project management can be a very important driver in enhancing both  
6 innovative culture (Highsmith, 2009) and organizational learning (Flumerfelt et al., 2012). Agile  
7 project management heavily relies upon the ideas of an empowered team. The empowered team in  
8 the agile project can make crucial decisions while executing the projects during the execution  
9 phase. So, it creates a culture in which such ideas are respected and promoted (Highsmith, 2009).  
10 The literature suggests that implementing an agile philosophy into the project would push the  
11 project organization to become innovative and gather a wide range of knowledge that can be  
12 continuously used while making the decision as part of upfront project planning (Flumerfelt et al.,  
13 2012). Thus, present research hypothesizes that,

14  
15  
16  
17  
18  
19  
20  
21  
22  
23 **H1:** *There is a positive and significant impact between agile project management and the project*  
24 *organization's innovative culture.*

25  
26  
27 **H2:** *There is a positive and significant impact between agile project management and project*  
28 *organization's learning.*

## 29 30 31 **2.2. Agile knowledge management:**

32  
33 Knowledge management can be defined as the process through which project teams or  
34 organization search, acquire, build the database, share and disseminate, and use the knowledge to  
35 improve products, services, productivity, and organizational performance (Pérez-Bustamante,  
36 1999). Although its proper conceptualization is non-existent in the present literature, Agile  
37 knowledge management would be better referred to as the usage of agile philosophy in the  
38 knowledge management process (Singh et al., 2014). Agile knowledge management specifically  
39 focuses on building and using the stock of knowledge, which can help project teams enhance their  
40 flexibility, adaptability, and cross-functional collaboration to yield better performance (Levy &  
41 Hazzan, 2009). Agile knowledge management makes a project organization's culture innovative  
42 by collecting and using a stock of information aimed at solving the problem arising from the  
43 project's unpredictability and complexity (Pérez-Bustamante, 1999). Therefore, the present  
44 research hypothesizes that:

1  
2  
3 H3: *There is a positive and significant impact between agile knowledge management and the*  
4 *project organization's innovative culture.*

5  
6  
7 H4: *There is a positive and significant impact between agile knowledge management and project*  
8 *organization's learning.*

9  
10  
11 In order to improve knowledge management, absorptive capacity is crucial for making good use  
12 of external knowledge. Organizations must build their "absorptive capacity," which is the ability  
13 to take in, process, and modify external information (Cohen & Levinthal, 1990). Strong absorptive  
14 abilities facilitate the assimilation of outside knowledge, which is essential for investigating novel  
15 ideas (Azeem et al., 2021). The connection between absorptive capacity and ambidextrous  
16 invention is essential for creating an atmosphere that promotes creativity and improves knowledge  
17 management (Anderson et al., 2014). Utilizing outside data to gain a sustained competitive edge,  
18 absorptive ability aids in striking a balance between exploratory and exploitative innovation.  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28

### 29 **2.3. Innovative capability:**

30  
31 The innovative capability is referred organization's dynamic capability, which helps it to develop  
32 and execute new and creative ideas for product, services, and business model that is instrumental  
33 in capturing the value from the consumers (Iranmanesh et al., 2021). The innovative capability has  
34 been linked with various positive outcomes such as higher productivity, financial performance,  
35 and satisfied customers (Çakar & Ertürk, 2010). The present research has operationalized the  
36 innovative capability of project teams as the antecedent of organizational culture (Iranmanesh et  
37 al., 2021) and learning (Bell & Figueiredo, 2012). The existing literature, albeit somewhat limited,  
38 tends to define innovative capability as outcomes rather than causes (Çakar & Ertürk, 2010).  
39 Moreover, certain researchers, like Iranmanesh et al. (2021), have utilized innovative capability as  
40 a moderator, while others, such as Azeem et al. (2021), have considered it an independent variable  
41 in conjunction with organizational culture. Therefore, it can be concluded that the literature on the  
42 operational aspect of innovative capability as a construct in relation to organizational culture is  
43 inconsistent. The present research, by agreeing with the empirical evidence that innovative  
44 capability can be a consequence of organizational culture, argues such assertion lacks a proper  
45 explanation of the process through which organizational culture would yield innovative capability.  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Further, the present research argues that a difference exists between traditional and innovative  
4 organizational cultures. The innovative organizational culture is different with respect to various  
5 elements. Therefore, the present research hypothesizes that;  
6  
7

8  
9 **H5:** *There exists a positive and significant relationship between innovative capability and*  
10 *innovative organizational culture.*  
11

12  
13 Further, the present research has also hypothesized that innovative capability can also yield  
14 organizational learning (Bell & Figueiredo, 2012). The project teams acquire innovative  
15 capabilities by acquiring information and knowledge from various sources. Thus, by developing  
16 innovative capabilities, organizational learning can have natural consequences.  
17  
18

19  
20  
21 **H6:** *There exists a positive and significant relationship between innovative capability and*  
22 *organizational learning.*  
23  
24

#### 25 **2.4. Growth mindset**

26  
27 The growth mindset can be described as the belief that an individual's or employee's varying nature  
28 of capabilities can be improved through learning, experiences, and experiments within and outside  
29 of the organization (Yeager & Dweck, 2020). The concept of a growth mindset further illustrates  
30 that employees with a growth mindset always embrace challenges to go out of their way to achieve  
31 something very special and extraordinary in nature, which also helps the organization in its quest  
32 to create higher value for its stakeholders (Yeager & Dweck, 2020). The view that failure is due  
33 to their abilities is not consistent with their mindset, but it is taken as an opportunity to learn and  
34 improve (Dweck, 2016). The present research has conceptualized that a growth mindset can  
35 positively affect organizational culture (Canning et al., 2016) and learning (Hanson et al., 2016).  
36 An innovative organizational culture always requires employees to develop a shared behavioral  
37 pattern in which they continuously seek new information, implement new ideas, and continuously  
38 improve themselves (Canning et al., 2016). Thus, the present research hypothesizes that;  
39  
40  
41  
42  
43  
44  
45  
46  
47

48  
49 **H7:** *There exists a positive and significant relationship between the growth mindset and*  
50 *organizational innovative culture.*  
51

52  
53 **H8:** *There exists a positive and significant relationship between the growth mindset and*  
54 *organizational learning.*  
55  
56  
57  
58  
59  
60

## 2.5. Organizational Innovative Culture:

Organizational culture can generally be defined as a set of values, norms, standards and behavioral patterns that are commonly shared by the organization's members (Ouchi & Wilkins, 1985). The innovative organizational culture can be defined as the values, norms, standards, and behavioral pattern of an organization that promotes activities of pursuing new ideas for products and services that are aimed at providing higher value to consumers and performance (Harmancioglu et al., 2020). For yielding ambidextrous innovation, innovative organizational culture plays an important role (Wang & Rafiq, 2014). Ambidextrous innovation requires the project team to successfully balance between developing new products and services from existing ideas, knowledge, and information and improving existing products from the same kinds of ideas, knowledge, and information (Khan & Mir, 2019). Such a balancing act, which is an inherent requirement of ambidextrous innovation, cannot be possible without a culture of project empowerment and motivating them to try and test ideas, look out for new information, and implement such kind of knowledge (Harmancioglu et al., 2020). Therefore, it can be hypothesized that;

*H9: Innovative organizational culture has a positive and significant impact on the ambidextrous innovation of project team*

## 2.6. Organizational Learning:

Organizational learning can be better defined as a “*process of improving actions through better knowledge and understanding*” (Fiol & Lyles, 1985, p.803). Organizational learning can be further explicated as it is processed through which organizations successfully obtain, develop a stock of knowledge, and implement such knowledge in order to develop better quality products, services, and value for the customers. The present research has hypothesized that ambidextrous innovation can be a natural consequence of the sustained and strategic level of organizational learning activities (Harmancioglu et al., 2020). Organizational learning helps the organization build a stock of knowledge and information on ideas that can be used to develop new products and improve existing ones (Prieto-Pastor & Martin-Perez, 2015). The organization tends to develop such kinds of ideas by actively seeking information and experience and experimenting both inside and outside of the organization (Li et al., 2022). Thus, it has been hypothesized here that,

1  
2  
3 **H10:** *Organizational Learning has a positive and significant impact on the ambidextrous*  
4 *innovation of the project team.*  
5  
6

### 7 **2.7. Ambidextrous Innovation:**

8  
9  
10 Ambidextrous innovation can be defined as the type of innovation that involves balancing between  
11 two types of distinct innovation strategies, which include both exploratory innovation and  
12 exploitative innovation (Hughes et al., 2010). Exploratory innovation can be defined as a type of  
13 ambidextrous innovation that is focused on meeting new kinds of consumer needs and demands  
14 by innovating new products and services (Grover et al., 2007). In contrast to exploratory,  
15 exploitative innovation is defined as the process of innovation in which the project team develops  
16 a product and services to meet existing needs and uses an existing set of knowledge (Martini et al.,  
17 2003). The present research has conceptualized that organizational learning (Prieto-Pastor &  
18 Martin-Perez, 2015) and innovative organizational culture (Khan & Mir, 2019) can play an active  
19 role in helping the firm achieve its ambidextrous innovation capabilities. The organization's  
20 learning always empowers the project team to collaborate cross-functionally to seek new insight  
21 and experiment with ideas that can develop an environment that may support explorative  
22 innovation (Prieto-Pastor & Martin-Perez, 2015). Further, organizational learning through the  
23 instrument of empowerment allows the project team to use the current set of information and  
24 knowledge while improving the current set of products (Li et al., 2022). In the end, a company is  
25 well-positioned to accomplish ambidextrous innovation and spur long-term success and growth if  
26 it values both exploratory and exploitative innovation and promotes a culture of continual learning  
27 and improvement (Wang & Rafiq, 2014). March (1991) argues that ambidextrous innovation  
28 entails resolving the conflict between exploratory and exploitative innovation techniques. While  
29 exploitative innovation maximizes current resources for operational efficiency, exploratory  
30 innovation seeks new opportunities and fosters creativity in unpredictable marketplaces (Battilana  
31 & Lee, 2014; O'Reilly & Tushman, 2013). Businesses operating in dynamic marketplaces must  
32 balance these strategies to foster innovation and stay competitive (Battilana & Lee, 2014).

### 50 **2.8. Conceptual Framework**

51  
52 The present research underpinning the ambidexterity and dynamic capability theory proposes that  
53 the act of balancing between explorative and exploitative innovation can be fostered through  
54 organizational culture (Iranmanesh et al., 2021), which values experimentation with ideas and  
55  
56  
57  
58  
59  
60

organizational learning (Bell & Figueiredo, 2012) which develops a stock of knowledge that can help in better both experimentation with new ideas of products and services and improving the existing one. The research further proposes in its conceptualization that both learning and culture appropriate for achieving ambidexterity should be based on antecedents such as agile-based project management (Lee et al., 2023), innovative capabilities (Ju et al., 2020), agile knowledge management (Azeem et al., 2021) and growth mindset (Yeager & Dweck, 2020). Thus, research proposes that such antecedents will help organizations develop culture and learning practices that are highly suitable for ambidexterity (Chakma et al., 2021).

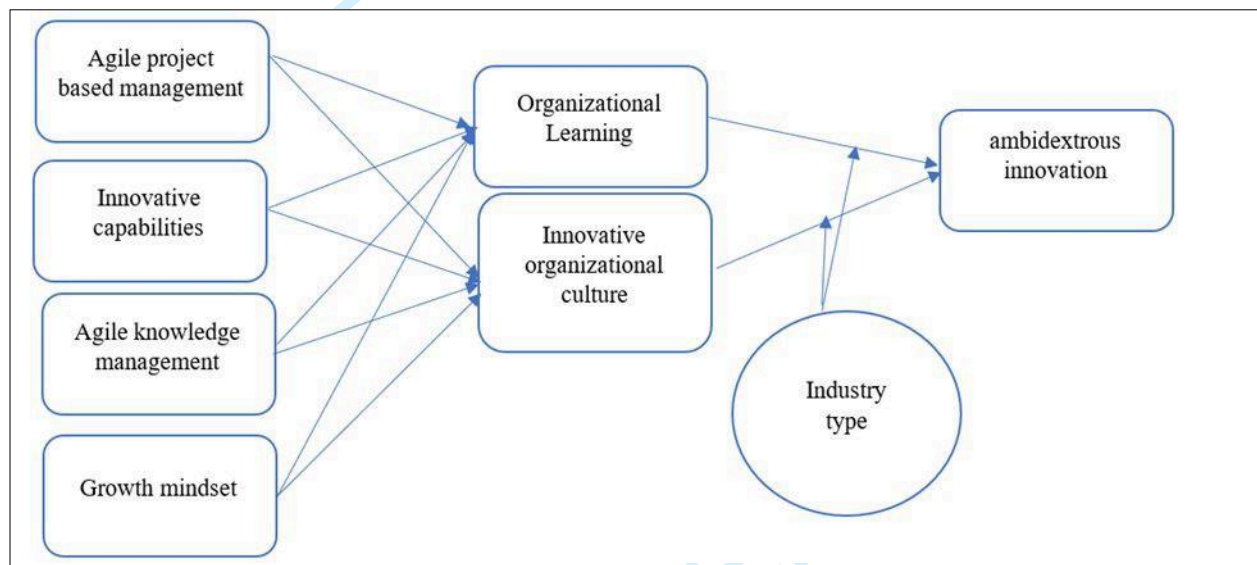

Figure 1: Conceptual Framework

### 3. Research Method:

#### 3.1. Research Design:

The present research has employed the quantitative research design. The current research aims to understand the impact of organizational learning and innovative organizational culture on ambidextrous innovation; thus, a quantitative research design can be used here to achieve such a purpose (Saunders et al., 2009).

The present research has employed the survey questionnaire as a data collection tool. The survey questionnaire is a popular data collection instrument in the quantitative research design in management science and organizational behaviour (Krosnick, 2018). The survey is an effective data collection instrument as it helps gauge respondent views, opinions and thoughts using a five-point Likert Scale.

### 3.3. Data Collection Instrument:

The present research has developed its data collection instrument from previous studies. The data collection instrument of the current research is divided into three parts. The first part is used to collect the demographic data of the respondents. The second part is developed to assess the relative knowledge of respondents on the phenomena of ambidextrous innovation. The last part consists of items to measure the variables of the study's conceptual framework. Table 1 shows the items used to measure each variable and their source.

Table 1: Data Collection Instrument

### 3.4. Sampling and Population:

The present research aims to collect data from Saudi Arabian public-sector firms with an increasing focus on using project management methodology and Ambidextrous Innovation to provide greater value to their stakeholders. Therefore, the population of the present research is the mid and senior-level managers handling projects and innovation at public sector firms, ranging from Small and Medium level enterprises to large sector corporations. To select the sample from a defined population, the present research has employed the non-probability purposive sampling strategy (Vehovar et al., 2016). The non-probability choice of sampling is appropriate as researchers cannot define the population from both qualitative and quantitative characteristics effectively and reach such population for data collection (Schreuder et al., 2001). The purposive sampling is effective here as the researcher has attempted to collect the data from qualified managers because such respondents either handle Ambidextrous Innovation, project management, or both (Etikan et al., 2016). The present research has employed the g\*power software to draw the sample size(Kang,

2021), which stands out at 290. Ther current research floated a questionnaire to 500 respondents into various SMEs firm using project management in different industries. The 373 respondents returned the questionnaire filled with their response. While further inspecting, 316 responses were filled fully with due diligence. So, the number of sample included in our data analysis stands at 316.

### 3.5. Data Analysis techniques:

The data analysis method used in this study was called Partial Least Square Structural Equation Modeling (PLS-SEM), and it was carried out with SmartPLS 3.40 (Hair et al., 2011). According to Hair et al.'s research from 2020, PLS-SEM is widely acknowledged as the tool of choice for evaluating complicated conceptual and route models and determining the nature of cause-and-effect interactions. In the current study, a measurement model and a structural model were used. The measurement model used a variety of statistical analyses and tests to evaluate the relative validity and reliability of the data and data collection instruments (Sarstedt et al., 2020). The structural model used a bootstrapping procedure that involved the creation of 5,000 subsamples to test the study's hypotheses.

## 4. Data Analysis

### 4.1. Demographic Analysis:

The data on demographic have been presented in Table 2. The results suggest that most of our respondents have reported the male gender, i.e., 63%, and the respondent who has reported the female gender is 37%. Further, most respondents have reported having an age group of 26-35 years (34%) followed by 18-25 years (28%). Further, respondents aged 26-45 years have reported 22%, and respondents aged 45 and more are reported to be 16%. The data on the respondents' experience suggests that most respondents have experience of 4-7 years, i.e., 43%, followed by 0-3 years, i.e., 29%. Moreover, 16% of people have reported having experience of 8-10 years, and 12% have reported having an experience of 11 years and more. Finally, the results of the data have suggested that the majority of respondents belong to the Department of Marketing and Sales (28%), followed by the Product Developed (22%) and Information Technology (20%). The respondents reporting Human resource management are 8%, operation management 6%, and finance 4%. The data also

1  
2  
3 shows that most of the firms in our data belong to the construction industry (53%). Project  
4 management is a widely used tool to provide products and services in the construction industry.  
5 Construction is followed by the IT and technology services industry (35%). IT and technology  
6 companies such as IT services, software houses and others are increasingly using project  
7 management as a tool to achieve their productivity. Finally, we have grouped different industries  
8 using project management into one or more functions as others.

Table 2: Demographic Analysis

#### 4.2. Construct Reliability and Validity

The present research, with the help of PLS-SEM, has assessed the construct reliability by employing the test of Cronbach alpha (Tavakol & Dennick, 2011) and composite reliability (Bacon et al., 1995) while construct validity is assessed through average variance extracted (AVE) (Dos Santos & Cirillo, 2023). The literature suggests that for the construct to achieve its reliability through both Cronbach alpha and Composite reliability, the value of both should be equal to or higher than 0.70 (Hair et al., 2011). Further, for the construct to achieve its validity through AVE, the value of AVE should equal or be higher than 0.50 (Hair et al., 2021). The results, which are shown in Table 3, conclude that every construct of the study has achieved its required threshold values on both construct reliability and validity.

Table 3: Construct Reliability and Validity

#### 4.3. Discriminant Validity:

The discriminant validity refers to the ability of each construct in the research model to report its uniqueness and distinguish itself from other constructs (Rönkkö & Cho, 2022). The discriminant validity is assessed in SEM to confirm the assumption that every construct is unique and measures its own phenomena (Rönkkö & Cho, 2022). The present research, with the help of SmartPLS 4.0, has assessed the discriminant validity through the Heterotrait-Monotrait ratio of correlations (HTMT). The research by Henseler et al. (2015) concludes that an HTMT value of 0.90 or below is considered to be the satisfaction of the discriminant validity assumption. The results for discriminant validity through HTMT are shown in Table 4, and it can be observed that HTMT

1  
2  
3 values in the table are lower than 0.90. Thus, it can be concluded that the present research has  
4 achieved the discriminant validity criterion.

57  
58  
59  
60

**Table 4:** Discriminant Validity

#### 4.4. Indictor reliability:

While construct reliability measures the reliability of a construct in the research model, item or indicator reliability measures the internal consistency of each of the items with its constructs (Hair et al., 2011). The PLS-SEM, through the use of SmartPLS 4.0, has allowed us to measure the indicator reliability through the criterion of outer loading. The wider literature suggests that, for each indictor to be assumed as reliable, it must report a value of 0.70 or higher. But, literature also suggests that outer loading with values lesser than 0.70 can be considered as reliable if the construct of the item has achieved its reliability (Hulland, 1999). Thus, the present research based upon the assertion of (Hulland, 1999) has retained items with outer loading value lower than 0.70. The results of outer loading are shown in Appendix 1.

#### 4.5. Explanation of variance:

The test of variance assessment has been conducted to determine the predictive power of the research model by understanding the extent to which the variance of each endogenous or independent variable contributes to the variance of exogenous variables or dependent variables. The variance assessment in the present research has been undertaken through the statistical criterion of R square (Hair et al., 2011). The results, as depicted in Table 5, show that both Innovative Organizational Culture and Organizational Learning, being endogenous variables in relation to Ambidextrous Innovation combined, contribute 44.4% variance. While agile knowledge management, agile project management, innovative capability, and growth mindset contribute a variance of 70% to innovative organizational culture and 69.4% to Organizational learning.

Table 5: Explanation of Variance

#### 4.6. Model Fitness:

1  
2  
3 Model fitness refers to the idea of how well a research model fits with observed data. The model  
4 fitness helps us to determine whether or not the research model is able to adequately represent the  
5 relationships among the variables in the data (Hair et al., 2021). The PLS-SEM through SmartPLS  
6 4.0 has allowed us to measure the model fitness with the help of Square Root Mean Residual  
7 (SRMR). The literature suggests that assuming the research model has achieved fitness, the SRMR  
8 value should be less than 0.10 (Hair et al., 2021). The results presented in table 6 show that the  
9 present research has achieved the model fitness through values of SRMR.

#### 29 30 **4.8. Structural Model:**

31 The study used bootstrapping in PLS-SEM to assess hypothesis effects. Most direct hypotheses  
32 were supported with significant values below 0.05, except for the relationship between agile  
33 knowledge management and innovative organizational culture. Additionally, both moderating  
34 hypotheses, examining industry type's impact on relationships, were not supported. The detailed  
35 analysis of these hypotheses is outlined in Table 7.  
36  
37

40  
41

42 Table 7: Assessment of Structural Model  
43  
44

## 45 46 **5. Discussion**

47  
48 Organizations have difficulties in maintaining their competitive advantage through products,  
49 procedures, and services in the face of intense rivalry, rapid technological advancement, and  
50 environmental concerns (Xie et al., 2020). However, firms may balance these demands and  
51 improve their competitiveness by implementing ambidextrous innovation (Santoro et al., 2019).  
52 Although academics and managers struggle with its implementation, it has tremendous potential  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 for organizations since it requires harmonizing old and new concepts to create distinctive solutions  
4 for consumers (Hughes et al., 2010). In response to this demand, ongoing research attempts to  
5 offer a framework that helps businesses achieve ambidextrous innovation.  
6  
7

### 8 9 **5.1. Organizational learning:**

10  
11 Organizational learning is an important source of building ambidextrous innovation capability.  
12 The ambidextrous innovation would require to use quality stock of knowledge which can be  
13 acquired through active engagement in learning activities at organizational level (Harmancioglu  
14 et al., 2020). The current study has hypothesized that innovative capability (Hanson et al., 2016),  
15 agile knowledge management (Morawiec et al., 2022), agile project management (Flumerfelt et  
16 al., 2012) and growth mindset (Hanson et al., 2016) can play an instrumental role in developing  
17 learning capabilities at the organizational level.  
18  
19

20  
21 The result of PLS-SEM analysis has confirmed all such hypotheses. The results suggest that agile  
22 knowledge management has both a positive and direct effect on organizational learning ( $p=0.000$ ,  
23  $\beta=0.331$ ) and an indirect effect on ambidextrous innovation through learning ( $p=0.015$ ). Thus, it  
24 can be concluded that organizational learning is directly affected by knowledge management by  
25 33.1% ( $\beta=0.331$ ), which in turn results in ambidextrous innovation. The idea of agile knowledge  
26 management can help organizations build their organizational capacity for learning by focusing on  
27 the acquisition of knowledge, which helps them to navigate into an environment of uncertainty  
28 (Morawiec et al., 2022). Thus, this kind of knowledge will help the organization to build the  
29 optimum level of ambidextrous innovation (Li et al., 2022)The results on agile project  
30 management have also confirmed the direct effect on organizational learning ( $p=0.003$ ,  $\beta=0.174$ )  
31 and the indirect effect on ambidextrous innovation through learning ( $p=0.038$ ). So, it is concluded  
32 that, organizational learning is directly affected by agile project management by 17.4% ( $\beta=0.174$ ),  
33 which in turn results in ambidextrous innovation. Further, project management, most importantly  
34 along the lines of agility, is becoming a favored management structure due to its efficiency and  
35 effectiveness. Agile project management can also help the firm build a level of learning capabilities  
36 through the experience of managing projects in uncertainty (Flumerfelt et al., 2012). Such  
37 experience can be converted into a stock of knowledge which can be helpful in the building of  
38 ambidextrous innovation (Wang & Rafiq, 2014).  
39  
40  
41  
42  
43

52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Finally, our data analysis through PLS-SEM has also shown that a growth mindset directly affects  
4 organizational learning ( $p=0.000$ ,  $\beta=0.478$ ) and indirectly affects ambidextrous innovation  
5 ( $p=0.011$ ). Therefore, it is concluded that the growth mindset affects organizational learning by  
6 47.8% ( $\beta=0.478$ ). The growth mindset entails that organization continues its growth trajectory by  
7 learning, experiencing, and experimenting with the capabilities required for optimal performance.  
8 Thus, learning is one of the key direct effects of a growth mindset (Hanson et al., 2016). Lastly,  
9 the present research has also found that innovative capability also has a direct effect on  
10 organizational learning ( $p=0.000$ ,  $\beta=0.239$ ) and an indirect effect on ambidextrous innovation  
11 ( $p=0.034$ ). So, it can be concluded that innovative capability has adequate 23.9% effect on the  
12 organizational learning ( $\beta=0.239$ ). The innovative as dynamic capability can continue to be  
13 replenished by actively experimenting with new ideas. Such experiments with new ideas develop  
14 the organizational capability of learning and provide a very significant source of developing  
15 ambidextrous innovation (Çakar & Ertürk, 2010).

## 26 **5.2. Innovative organizational culture:**

27  
28 The present research has proposed that innovative organizational culture is also an important  
29 predictor of ambidextrous innovation capability. The continuing balance between explorative and  
30 exploitative ideas requires favorable culture. The present research theorizes that innovative  
31 capability, agile knowledge management (Pérez-Bustamante, 1999), agile project management  
32 (Highsmith, 2009), and growth mindset (Canning et al., 2016) are important antecedents of  
33 innovative organizational culture.

34  
35 The result data analysis has confirmed that agile project management ( $p=0.000$ ,  $\beta=0.291$ ), growth  
36 mindset ( $p=0.000$ ,  $\beta=0.324$ ), and innovative capability ( $p=0.000$ ,  $\beta=0.309$ ) have a direct effect on  
37 the innovative organizational culture. The results concluded that agile project management affect  
38 the innovative organizational culture by 29.1% ( $\beta=0.291$ ), and it could be an important source of  
39 developing an innovative organizational culture. The agile project management idea entails that  
40 project teams need to be highly agile by operating in a very volatile and uncertain environment  
41 (Highsmith, 2009). Thus, once the project team starts working on the agile philosophy, the  
42 development of innovative culture in organization in which teams are empowered to explore and  
43 work on new ideas can be the important consequence. Further, agile project management through  
44 innovative culture can also lead to ambidextrous innovation ( $p=0.000$ ).

1  
2  
3 Further, results also entail that innovative capability is a strong predictor of innovative  
4 organizational culture by 30.9% ( $\beta=0.309$ ). The strong innovative capabilities exhibit a culture of  
5 adaptability and evolution in the market. Such kind of behavior as part of innovative capability  
6 ignites the passion for generating and experimenting with new ideas. Further, innovative  
7 capabilities with a strong culture can push members of teams to actively seek different ways  
8 through which exploitative and explorative ideas are balanced. Thus, an indirect effect of  
9 innovative capability on ambidextrous innovation can also be found here ( $p=0.00$ ).

10  
11  
12 Finally, our data analysis through PLS-SEM has also shown that a growth mindset has a strong  
13 direct effect on innovative organizational culture by 32.4% ( $\beta=0.324$ ) and an indirect effect on  
14 ambidextrous innovation ( $p=0.000$ ). When teams and individuals within an organization accept a  
15 growth mindset as a way to lead through a hyper-competitive world, they start to believe that  
16 teams' abilities and intelligence can be developed through learning and development. Such attitude  
17 at the organizational level fosters a culture of new ideas and innovation (Canning et al., 2016)

### 26 27 **5.3. Ambidextrous innovation:**

28  
29 The present research has further hypothesized that innovative organizational culture (Khan & Mir,  
30 2019) and organizational learning (Prieto-Pastor & Martin-Perez, 2015) directly affect  
31 ambidextrous innovation ( $p=0.007$ ). The results further conclude that organizational learning  
32 affects ambidextrous innovation by 16.7% ( $\beta=0.167$ ). The research finds that for organizations to  
33 balance new radical ideas and those improving existing ones, they need substantial knowledge.  
34 This knowledge helps project teams explore new concepts and crucially, integrate them into  
35 enhancing current product and service lines. Further, the present research also concludes that the  
36 innovative culture of an organization that focuses on innovation also plays an important part in  
37 balancing explorative and exploitative ideas ( $p=0.000$ ). The results of PLS-SEM analysis have  
38 confirmed that organization with innovative cultures can enhance their ambidextrous innovation  
39 by 55.4% ( $\beta=0.554$ ). The explorative and exploitative ideas can not be developed in an  
40 environment defined by a traditional management structure. These ideas need a culture in which  
41 new ideas are not just appreciated, but teams are empowered to experiment with those ideas. Thus,  
42 it is concluded that innovative organizational culture can be an important source for developing  
43 ambidextrous innovation capability.

### 54 55 56 **5.4. Moderation effect of Industry type.**

57  
58  
59  
60

1  
2  
3 The present research proposed that, there is a moderating effect of industry types on innovative  
4 organizational culture, organizational learning, and ambidextrous innovation. It implied that  
5 different consequences would be seen in sectors like software and technology, which are renowned  
6 for their agile and project-based organizational structures. In the meanwhile, thanks to economies  
7 of scale, project-based yet resource-constrained businesses like construction may prosper.  
8 However, our analysis did not support the theorization of moderation analysis of industry types as  
9 both hypothesis of moderation analysis of ambidextrous innovation with organizational learning  
10 (p=0.379) innovative organizational culture (p=0.473).  
11  
12  
13  
14  
15

## 16 17 18 **6. Conclusion:**

19  
20 In an increasingly hyper-competitive and technologically sophisticated industrial macro-  
21 environment, present research concludes that firms need to develop capabilities in which not just  
22 new ideas for products and services are being increasingly focused, but existing products and  
23 services are also improved through fresh insights and ideas. The ambidextrous innovation research  
24 has taken an interest in the scholarly community. The present research first theorized and tested  
25 the significant impact of both organizational learning and the innovative culture of the  
26 organization. It is concluded here that idea both for new and existing product and services requires  
27 a significant quantity and quality of knowledge, and such knowledge can be acquired and used  
28 through the active process of learning at organizational level. Further, the present research also  
29 concludes that it is also indeed important to have a stock of knowledge that is significant from  
30 qualitative and quantitative dimensions. Still, a culture of innovation will play a complimentary  
31 role in which knowledge is applied, experimented, and tested for new and existing products and  
32 services. Therefore, innovative organizational culture, along with organizational learning, can play  
33 an important role in enhancing the firm's ability to ambidextrous innovation. Further, this study  
34 also has broadened the conceptual building of ambidextrous innovation by incorporating factors  
35 that can have indirect effects. The research concludes that various factors can play an important  
36 indirect role in yielding ambidextrous innovation through organizational learning and culture.  
37 These can include agile project management, agile knowledge management, a growth mindset,  
38 and innovative capabilities.

### 52 53 **6.1. Theoretical implications**

54  
55  
56  
57  
58  
59  
60

1  
2  
3 The current research offers implications for the theory of ambidextrous innovation and dynamic  
4 capability. First, the present research has concluded an important role that ambidextrous  
5 innovation can play in today's era of competition and technological sophistication. Thus, it is  
6 imperative for firms that navigating into such an environment would require them to try out new  
7 ideas for products and services and seek a way to improve existing ones. Secondly, by building  
8 upon the dynamic capabilities, our study has concluded that both learning and culture are important  
9 sources of ambidextrous innovation. Third, important capabilities such as agility in project and  
10 knowledge management, general innovative capability, and growth mindset can also have a  
11 significant impact on developing a firm's capability of ambidextrous innovation. Thus, present  
12 research has attempted to advance the field and theory by deepening our understanding of the role  
13 of ambidextrous innovation and dynamic capabilities. The present research further highlights the  
14 important role of organizational learning and culture that postulates that organizational  
15 ambidexterity as a dynamic capability can be continuously enhanced through learning and  
16 experimenting with explorative and exploitive ideas. The ideas for both exploration and  
17 exploitation are a direct result of active learning that takes place within the organization with an  
18 additional role absorptive capacity plays. Further, present research postulates the additional  
19 capabilities of organizations, such as agility and growth mindset. It enriches the theoretical  
20 landscape by providing a more comprehensive framework for analyzing how firms can achieve  
21 ambidextrous innovation in today's competitive and complex business environment.  
22

## 35 36 **6.2. Managerial implications**

37 The present research offers numerous implications for managers. First, for developing  
38 ambidextrous innovation, present study provides managers the opportunity to keep the focus on  
39 developing organizational learning capabilities through actively seeking knowledge on the  
40 philosophy of agility. Second, current research offers project managers to become more agile in  
41 their nature to achieve ambidextrous innovation. Third, the study offers managers to focus on a  
42 growth mindset and unleash their innovative capability to develop knowledge that will help them  
43 achieve ambidexterity. Finally, the present study offers managers to focus on a culture that fosters  
44 innovation. The culture that fosters innovation should empower employees in seeking and  
45 experimenting with ideas for new and existing products and services. From this study, managers  
46 may gain practical insights to strengthen the ambidextrous innovation initiatives inside their firms.  
47

54  
55  
56  
57  
58  
59  
60

1  
2  
3 The study emphasizes how crucial it is to actively encourage organizational learning, cultivate an  
4 innovative culture, and embrace agility in project management. The need to encourage a growth  
5 mentality among teams is also emphasized. This will allow managers to lead their organizations  
6 toward striking a dynamic balance between exploration and exploitation, which will promote long-  
7 term success and flexibility in a market that is changing quickly.
